Subject: Software Engineering Lab2
Date: 27-08-206

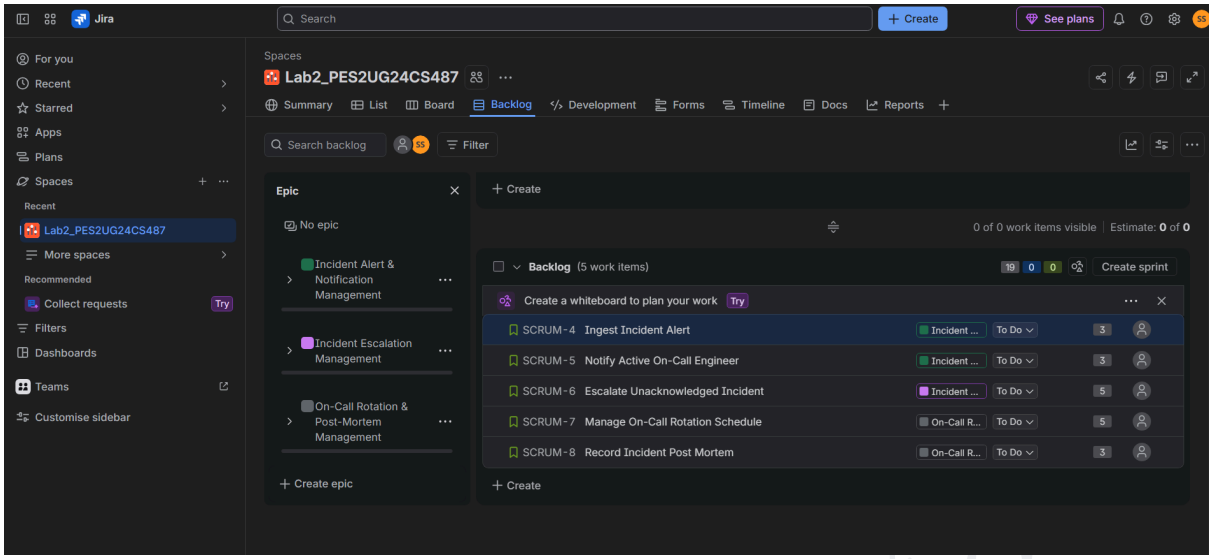

Screenshots with explanation

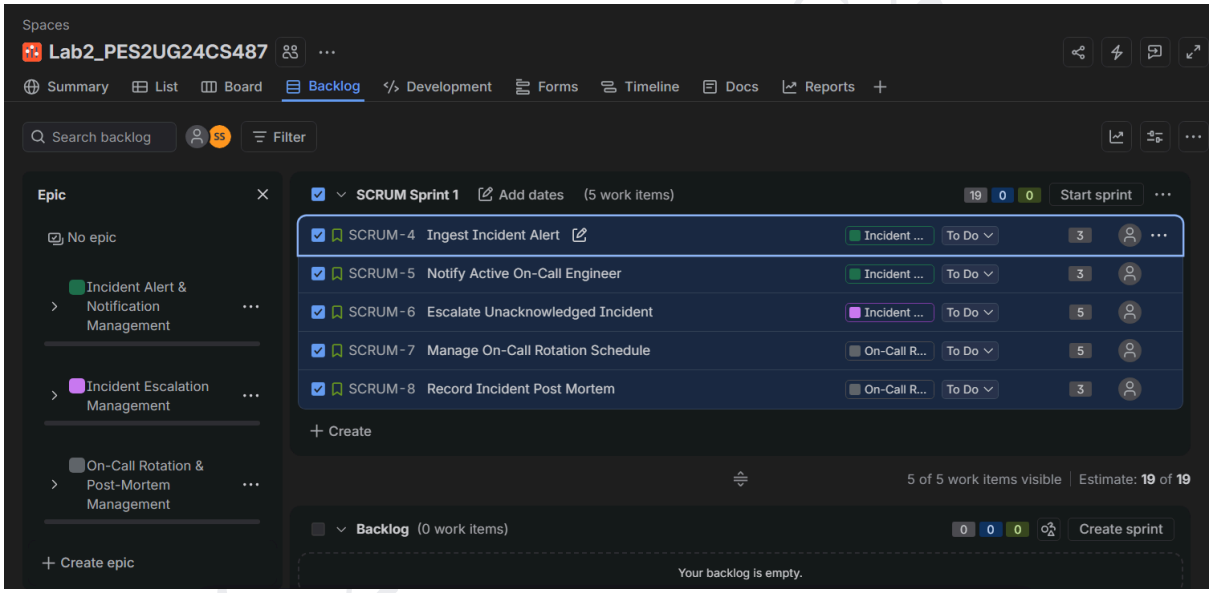

this screenshot shows the three epics and their one user story successfully created in Jira.

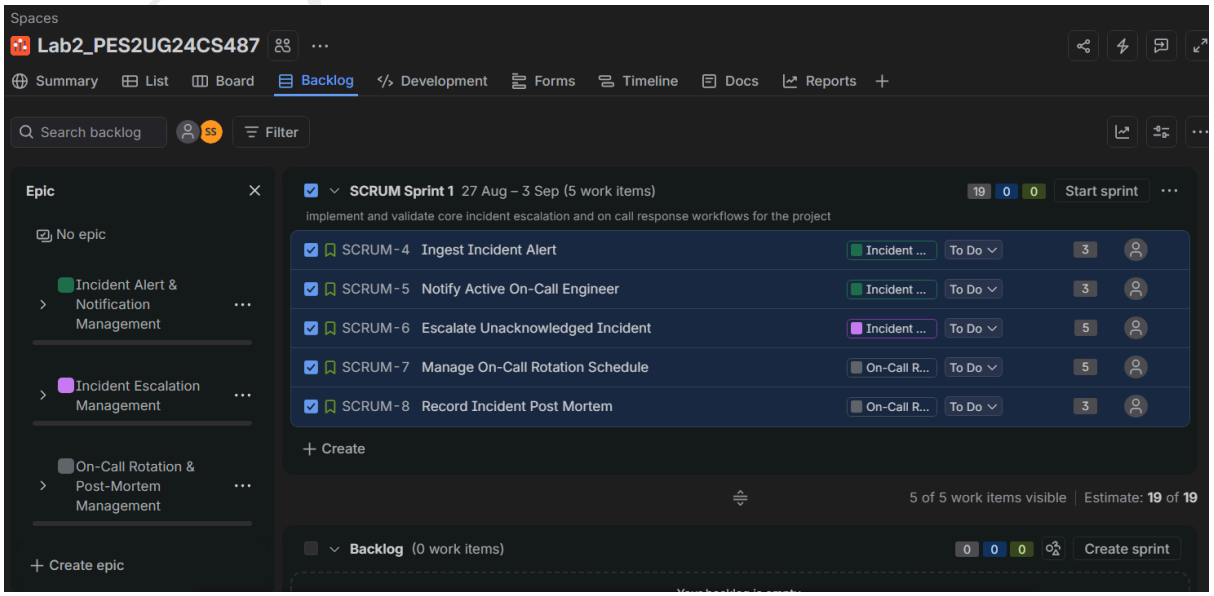

this one shows all five user stories organized under their respective epics in the backlog

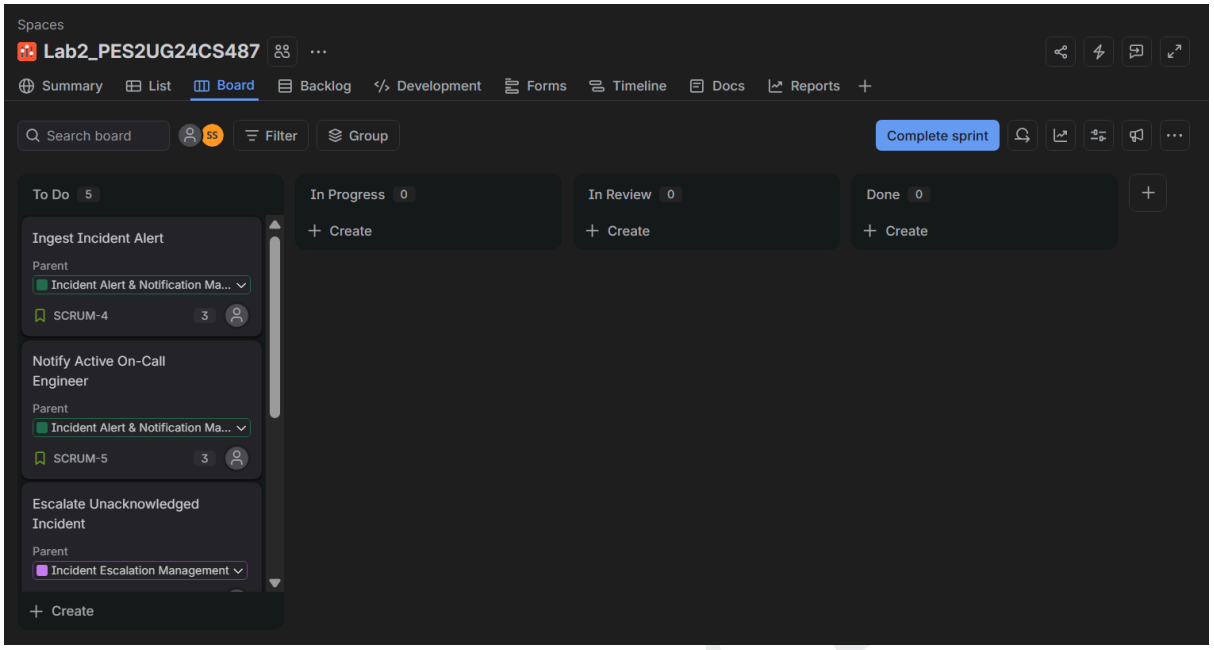

the story point estimates have been assigned according to importance to each of the user stories

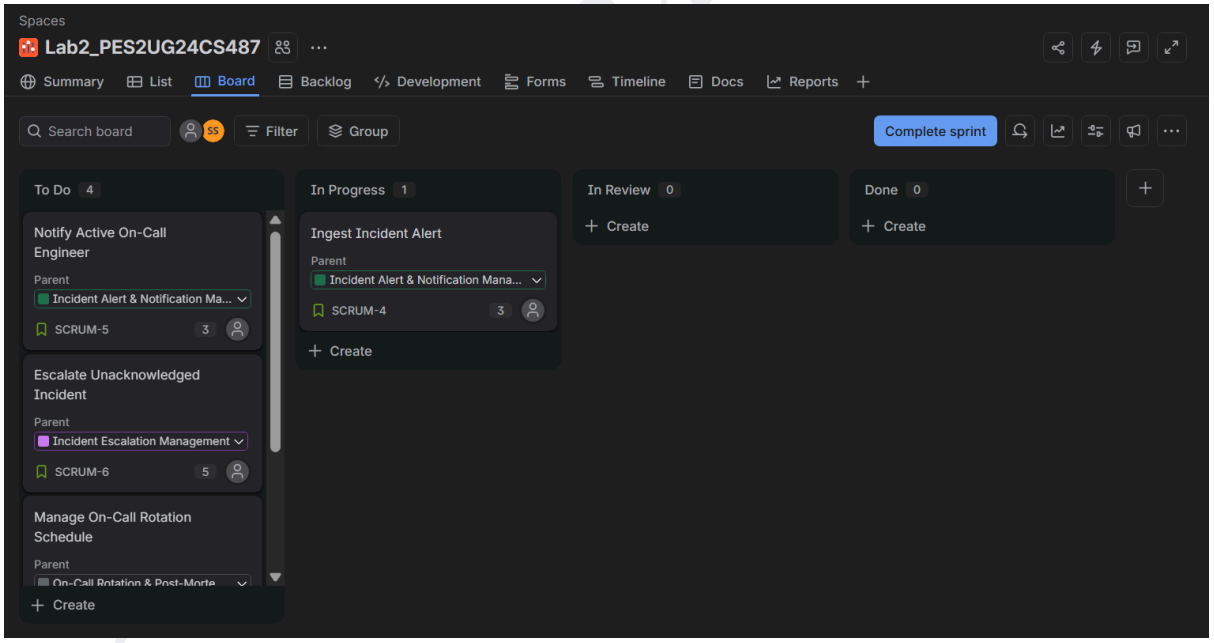

showing all five user stories successfully moved from the backlog into Sprint1

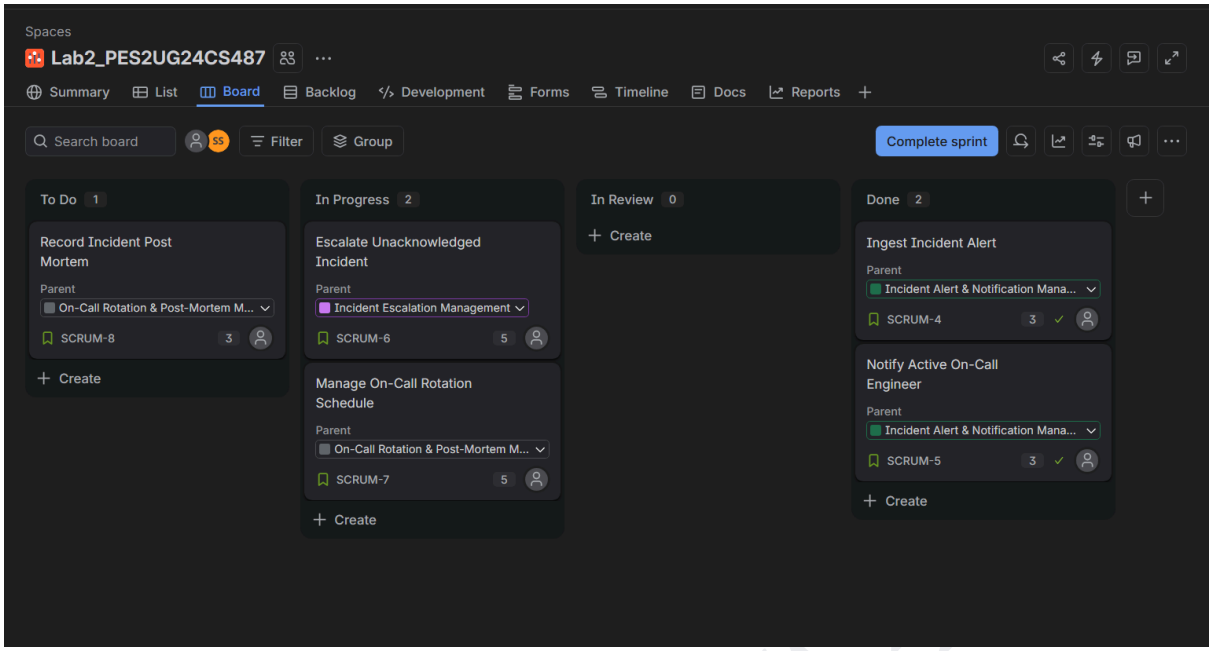

shows the sprint dates and sprint goal added to the planned sprint 1 (1 week deadline for the given sprint starting today)

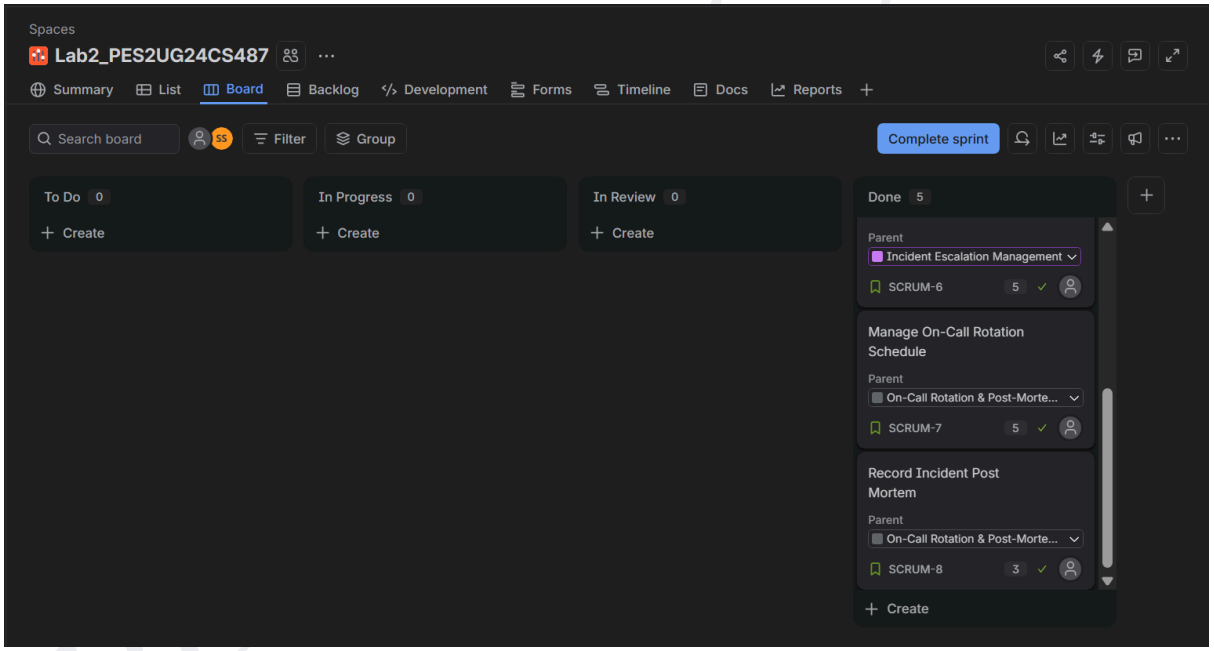

Sprint in now made active , here the screenshot shows the active sprint with all five stories initially in the To Do column.

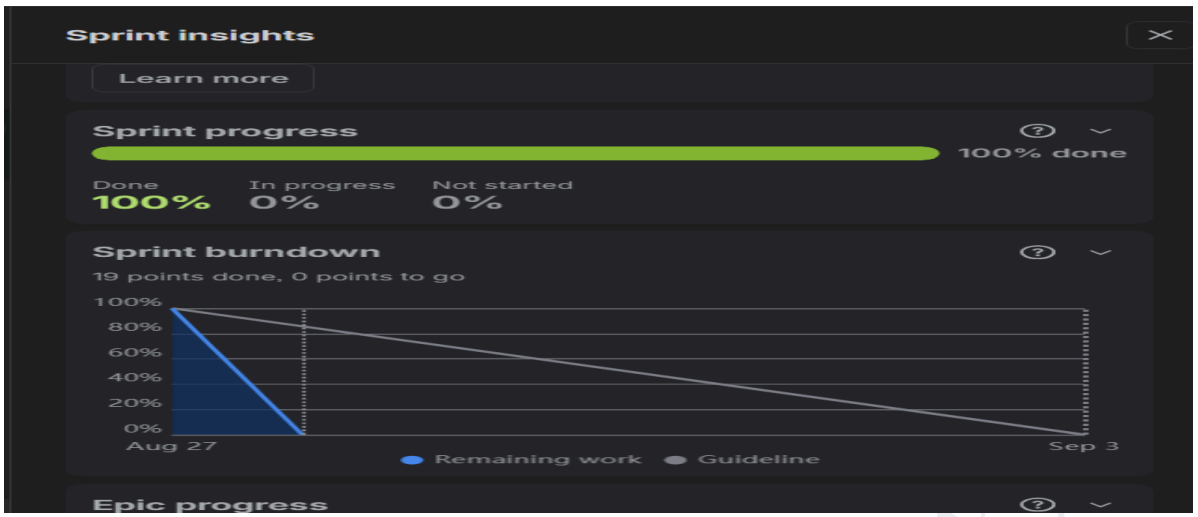

this one shows the stories being pushed through the workflow, with some moved to In Progress.

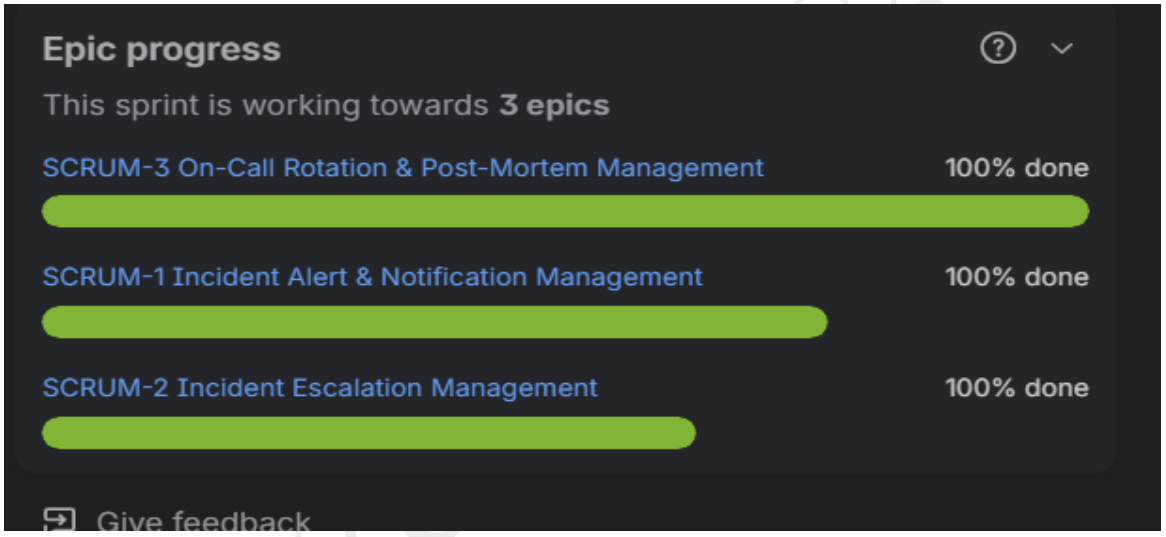

in progress workflow , some stories are done while some are in progress

final completion shows all five user stories completed and moved into the Done column

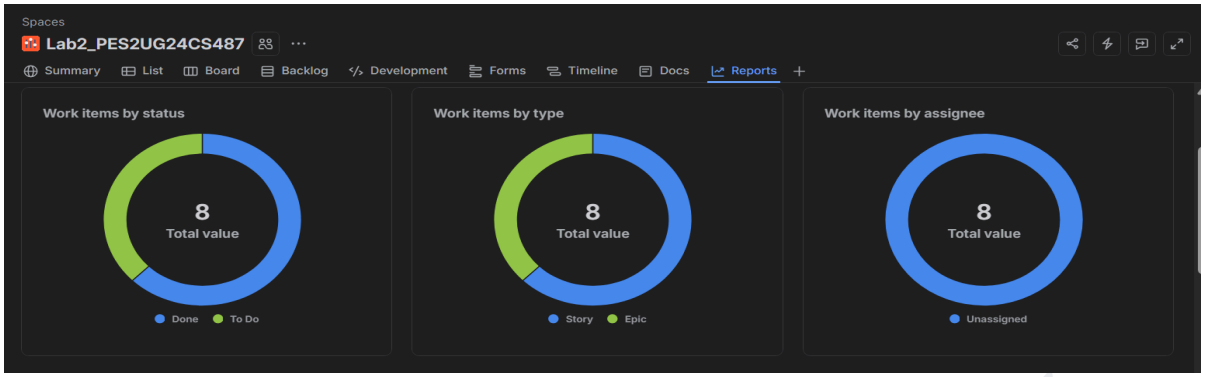

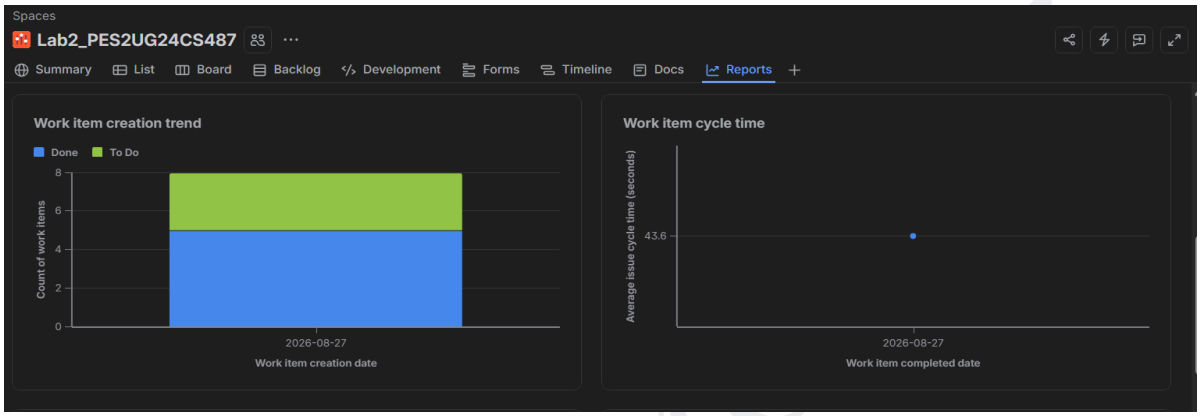

this screenshot shows the sprint statistics confirming that all 19 story points were completed (the user story points that we added , 3 and 5) also given is the sprint burndown chart

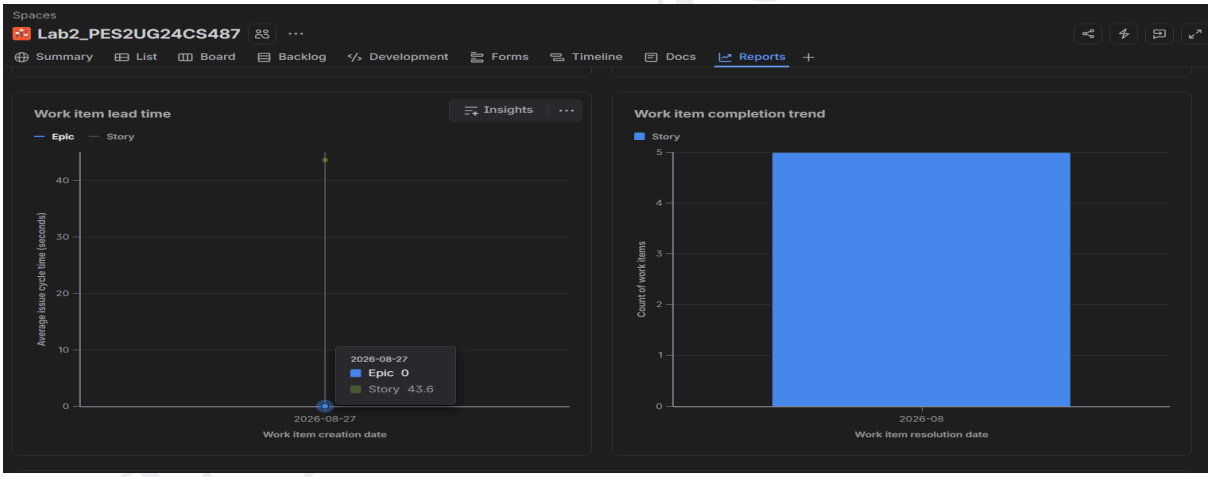

the stats showing 100% completion progress for all three epics

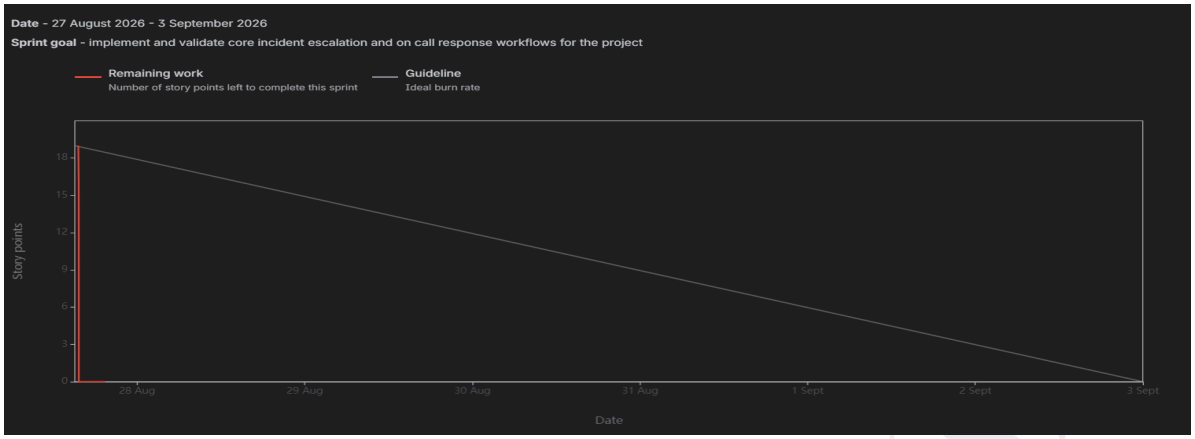

Following screenshots are the reports after scrum is marked as completed. it contains Jira's work-item status, type, and assignee reports for the project (this was unassigned since it was just me) , also contains work-item creation trend and cycle-time report generated by Jira.

Final sprint burndown chart reaching zero remaining story points, confirming the sprint work was completed

Reflection Questions:

1) Did your estimations reflect the actual effort?

Yes it did. The story-point estimates were aligned with the effort and complexity of the user stories. The basic tasks, such as ingesting alerts and recording post-mortems, were estimated at 3 points, while more complex tasks such as incident escalation and managing the on-call rotation were estimated at 5 points. I couldn't really find the option to assign priorities hence had to make my way with these points. Since all five user stories were completed during the simulated sprint, the estimates were suitable for the planned workflow

2) Was your backlog well-prioritized?

Yes. The backlog was organized according to the importance of incident response functionality. Alert ingestion, notification, and escalation were treated as the core incident-handling functions, while on-call rotation and post-mortem management supported the overall process and had a lower priority as compared to the ones above. This helped structure the work logically.

3) How did your simulated sprint align with your plan?

All my five user stories were moved into Sprint 1, which was planned as a one-week sprint starting today. then these stories progressed from To Do through In Progress then finally to Done. By the end of the simulation, all five stories and all 19 story points were completed.

4) What insights did the burndown chart give about your team's capacity?

As of today there was no team as such , just me . However ,the burndown chart showed that the sprint had a total of 19 story points and that the sprint progress reached 100% completion. This indicates that the team (me for today) was able to complete the planned workload within the simulated sprint of the given timeline

PES2UG24CS487

(1 week). The chart also demonstrated how remaining work can be tracked against the planned sprint timeline and used to understand whether the team is on track.
